

Sauron local integration: Amber Relay

Fictional test procedure - Revision 2.0 - 19 September 2026

This is synthetic test data, not Cisco product guidance. Use only to validate document retrieval and original-file downloads.

Prerequisites

Obtain an approved maintenance window and export the current Amber Relay configuration before deployment. The required lab package is amber-relay-2.0.test.

Warnings

Applying the lab route may interrupt traffic for 30 seconds. Do not proceed without the configuration backup.

Procedure

1. Select the lab branch named Cedar-17.
2. Upload amber-relay-2.0.test and set the lab route tag to 417.
3. Apply the change only to Cedar-17.

Verification

Run the fictional command amber relay status. Success means status READY and route tag 417.

Rollback

If status is not READY within 90 seconds, restore the exported configuration and verify the prior route tag.

Diagnostics

If the status is WAITING, check whether the maintenance window is active. A missing window means the deployment should be deferred.
